

PET Scan with Sedation

Positron Emission Tomography

What is a PET Scan?

Note: Child-friendly language in Green.

- A PET scan is used along with a CT Scan (computed tomography) to give detailed 3D pictures of inside your child's body.
- Our PET scanner (**camera**) looks the same as the CT scanner. It has a small tunnel with a bed that moves in and out. Some kids say it looks like a spaceship or doughnut.

Patient in PET Waiting Room

Why is it done?

- A PET scan uses a radioactive isotope (**picture medicine**) to show how certain parts of the body create and use energy.
- A PET scan can show pictures of how your child's organs and tissues are functioning that CT and MRI do not.
- Pictures from a PET scan help doctors diagnose a problem, choose the best treatment for your child, and/or evaluate how treatment is working.

PET Scanner Camera

What can I do to help my child?

- Parents/caregivers are strongly encouraged to stay with their child throughout the entire procedure whenever possible. Women who may be pregnant cannot be with their child during all phases of PET Scan. In these cases, another trusted adult is encouraged to stay with the child during this time.

What should I expect during the procedure?

A PET Scan is done in 3 stages. The entire process takes about 4 hours. Results will be sent to your doctor in 1-2 business days.

Stage One: Getting Ready

- Radiology staff will bring you and your child into a room to get ready for the pictures, called the Prep Room. Here, a nurse will check your child's vital signs (**temperature, blood pressure, and weight**) and ask general questions about your child's health.
- Then nurse will then place a numbing cream on your child's hands and/or arms to help make placement of an IV (**small, soft straw placed into a vein using a small needle**) more comfortable.
- Next, a nurse will gently place the IV, which will help get fluids into your child's body throughout the exam. At this time the nurse will take a small sample of blood from the IV to test your child's blood sugar level.
 - * Your child may feel a little discomfort, like a quick, tiny poke when the IV tube is placed.
 - * Encourage your child to hold his or her arm very still and to take deep breaths.

Stage Two: Warming Room

- After your child has his or her IV, a nurse will walk you and your child back to the warming room. Your child will be provided warm blankets and a comfortable chair to sit or lay back in.
 - * It's important for your child to be warm because being cold can create blurry pictures.
 - * Encourage your child to relax and not to talk because movement can affect the scan. We will dim the lights to help improve the environment.
 - * Talk with your child about what they think will help them stay still such as taking a nap, thinking of their favorite place, etc. We can provide movies and/or soft music to help your child stay still.
 - * This "warming phase" will last for about 60 minutes.
- After the warming phase is complete, the technologist will inject the radioactive isotope (**picture medicine**) through your child's IV.
- Your child will now be in the "soaking phase," and will need to stay still for about 60 more minutes. You will be asked to move behind a lead barrier to help protect you from the radiation.

Stage Three: Pictures

- Next, you and your child will be walked to the scanner (**camera**), and your child will be helped onto the camera bed.
 - * Encourage your child to look at the ceiling and see the trees and clouds.
 - You can stay with your child while he or she is induced (**helped to fall asleep**) with a nurse and anesthesiologist (**sleepy medicine doctor**) present.
 - * Some kids' bodies and eyes move around as they are falling asleep. Don't worry, this is very normal.
 - * A nurse and/or anesthesiologist will be monitoring your child during the entire scan and recovery period.
 - The scan time is about 60 minutes and you will be notified immediately after your child's scan is done. You will be brought back to the recovery area, so you can be with your child as he or she wakes up.
- 

Tips for preparing your child for a PET Scan with Sedation

Infants (0-12 months old):

- Remember you are the most important thing to your child. Your presence will help them feel as safe and secure as possible.
- Take care of yourself too. If you are prepared mentally and physically, you will be more relaxed around your child.
- Bring familiar objects that comfort your child such as a favorite blanket, toy or pacifier.
- Remember that children use many different ways to cope. Crying is a healthy and normal way to cope because it allows them to express their emotions.

Toddlers (1-3 years old):

- Begin preparing your child the day before.
- Use simple words to describe what your child may experience.
- Tell your child they will have some pictures taken so the doctor can learn more about his or her body.
- Reassure your child that you will be close and that the special, big camera will not touch him or her.
- Bring comfort items with you that help your child feel safe, such as a favorite toy or blanket.
- Toddlers are learning to be independent and make their own choices; offer them realistic choices. For example, “What stuffed animal should we bring?”

Preschoolers (3-5 years old):

- Begin preparing your child about 1-3 days in advance.
- Talk to your child about why they are having pictures taken. For example, “The doctor wants to take special pictures of your body to learn more about how your body works.”
- Use simple words to describe what your child may experience.
- Let your child know that their job is to stay very still during the warming and soaking periods. For example, “Holding still and staying quiet is really important to help get ready for your pictures.”
- Talk with your child about what they think can help them stay calm and still during these times.
- Encourage your child to ask questions.

School Age and Up (6 years old and Up):

- Prepare your child at least a few days in advance.
- Talk to your child about why the doctor wants to take pictures of inside his or her body. For example, for a younger child, “So the doctor can learn more about how your body works.” For a teen, “So the doctor can find out more about your diagnosis and treatment.”
- Explain to your child what he or she might, see, hear and feel, in the order things will occur, using child-friendly and/or real terms depending on your child’s preference.
- Let your child know that they will need to stay very still during the warming and soaking periods to get ready for the pictures. Discuss what might help them stay relaxed and still during these times.
- Encourage your child/teen to ask questions.

Child Life

Children's National Medical Center Department of Radiology is staffed with two full-time Child Life Specialists at Children's National Medical Center Main Campus. Child Life Specialists are trained to address the emotional and developmental needs of children and their families during healthcare experiences, and can provide procedural preparation and support before and during your child's exam.

Phone Numbers

- If you would like to speak to a Child Life Specialist before your child's Radiology appointment at Children's National Medical Center Main Campus, please call **202-476-3338**.
- For more information about hospital-wide Child Life Services at Children's National Medical Center, please call **202-476-3070**.

Children's National Medical Center supports the Image Gently campaign and strives to keep radiation exposure to our patients as low as possible. For more information on this campaign, please visit www.imagegently.org
