At Children’s National Health System, our physicians and researchers have pioneered treatments used around the world to cure cancer in children. One of our scientists helped identify the gene that causes the most common type of muscular dystrophy. And our team performs nearly 15,000 surgeries a year on children—from babies a few hours old to teenagers.

If we could bring this world-class care to your home, we would. Instead, we have done the next best thing by providing the same quality of care as the hospital, only closer to your home in our Regional Outpatient Centers or affiliated practices.
